## Vision Solutions Extends Operating System and Database Support with Double-Take Share 5.3

Cross-platform data sharing solution delivers real-time access to database information for improved business decision-making and greater productivity

**Irvine, Calif., December 9, 2014** – [Vision Solutions, Inc.](#), a leading provider of disaster recovery, high availability and migration software and services, today announced the release of Double-Take® Share™ 5.3, the latest version of the company's [cross-platform data sharing solution](#). Double-Take Share improves organizational decision-making and productivity by making it easy to replicate mission-critical data across multiple databases, incompatible applications and differing hardware and operating system platforms. Version 5.3 adds support for IBM's Linux on Power operating system, Oracle RAC and the latest versions of Microsoft SQL Server and IBM DB2 for Linux, Unix and Windows. Replication performance is also increased for Teradata and IBM i platforms, making access to real-time data better than ever.

"With the surge in data volume expected to continue at an exponential rate, the ability to [replicate database information](#) in real time is essential," said Alan Arnold, chief technology officer at Vision Solutions. "Strong business intelligence creates competitive advantages, and the need for data to move smoothly to the platform on which it is required, in the format needed, is more important than ever before for improved decision-making. Our Double-Take Share product provides easy, cross-platform data replication to enable business intelligence or analytics, consolidate databases or migrate to modern platforms. Double-Take Share 5.3 helps realize synergies across the enterprise by effectively leveraging business-critical data."

Double-Take Share 5.3 makes company information available for queries, reports, business intelligence and data warehousing across multiple platforms, creating flexibility for business operations and scaling for future growth.

New capabilities introduced with Double-Take Share 5.3 include:

- Support for Oracle RAC
- Support for Microsoft SQL Server 2014, whether on-premise or in the cloud
- Support for IBM Linux on Power
- Refreshed support for the latest versions of IBM DB2 for Linux, Unix and Windows
- Increased performance when loading data into Teradata databases through the use of Teradata Parallel Transporter
- Accelerated performance in IBM i environments and added support for the IBM i 7.2 operating system

As with prior versions, Double-Take Share 5.3 provides [real-time replication](#) of data between databases, even if they're on different hardware, operating systems or database platforms. As a result, decision-makers can be sure they are always working with the freshest data regardless of its point of origin. This product also makes it easy for users to offload selected portions of the data to drive insights for development, testing, reporting and other purposes without impacting or putting the production system at risk.

"Double-Take Share 5.3 enables us to replicate data in real time from our IBM i server running Infor's M3 ERP package to a Microsoft SQL Server database on a Windows 2008 server for business intelligence reporting and analysis," said Krister Andersson, IT manager for Eldon AB in Sweden. "Using Double-Take Share to offload data to our data warehouse is less intrusive on our production server and supports real-time, accurate data sharing for business decision-making throughout our organization. Double-Take Share 5.3 performs brilliantly, has been easy for us to monitor and makes the replication process fast and effective so that ultimately our data insights can be more robust."
